

# HEXAGON INCORPORATED

OFFLINE  
DATABASE MANAGEMENT SYSTEM

**-: Group members :-**

**Sumit Saha**

**Submitted by**

**Sumit Saha**

**Class 12<sup>th</sup> B**

**Roll No.-9203528**

## *Acknowledgements*

The following program has been made by Sumit Saha under the proper guidance of Mrs. Alka Jayaswal and much appreciated help from Mrs. Prema Rawat, our Lab Assistant.

We would like to dedicate our work to our parents who have supported us throughout. Last but not the least we would like to thank our inspirations from the biggest of the software industries –

Mr. Bill Gates and Late Steve Jobs whose work have inspired us to create something on our own.

But before we present ourselves we would like to assure the viewers a much better version of this program which would be converted into software in the following years.

THIS IS TO CERTIFY THAT THE PROJECT ON C++ OFFLINE DATABASE SYSTEM HAS BEEN SUCCESSFULLY EXECUTED BY SUMIT SAHA OF CLASS XII-B IN THE SCHOOL'S COMPUTER LAB UNDER THE PROPER GUIDENCE OF OUR RESPECTED TEACHER MRS. ALKA JAYASWAL.

THE FOLLOWING PROJECT HAS BEEN SUBMITTED FOR THE CENTRAL BOARD OF SECONDARY EXAMINATION.

---

Mrs. Alka Jayaswal

SCREENSHOTS

OF OUTPUT

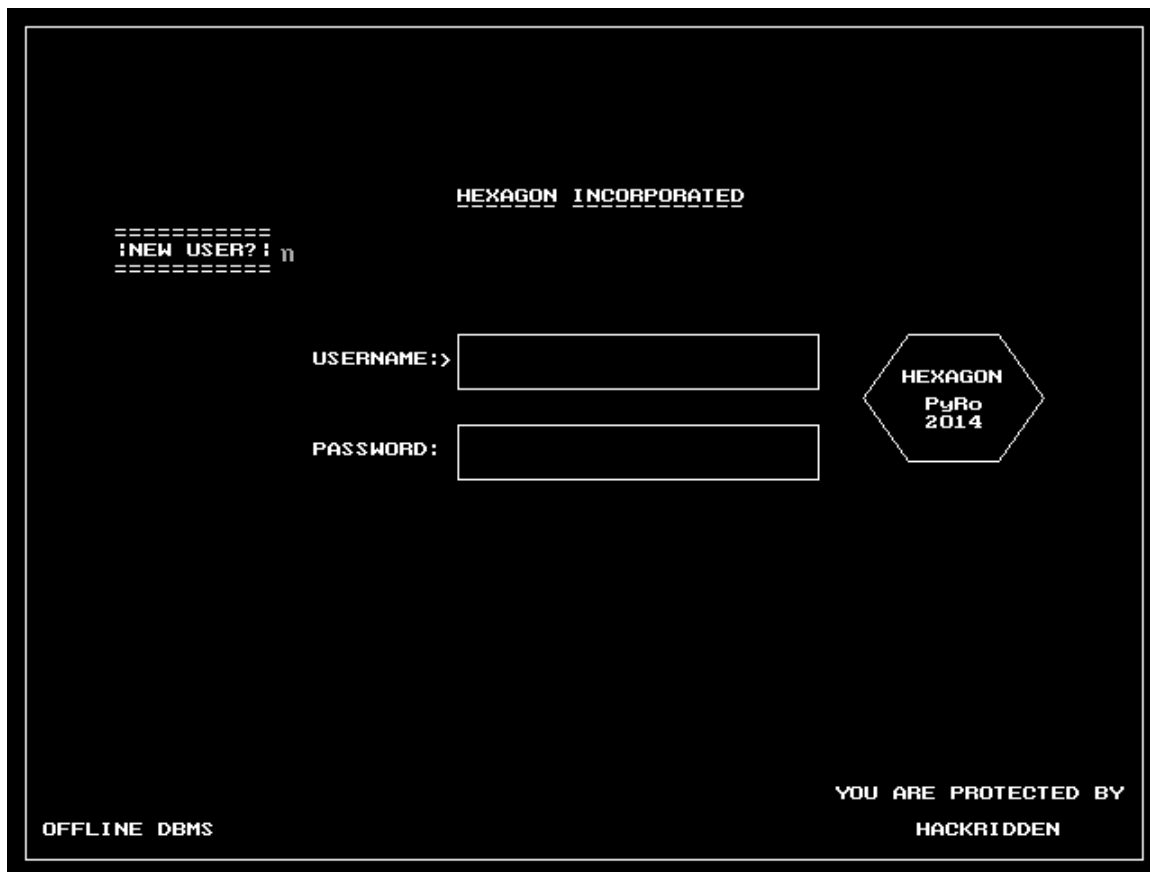

SCREEN

The program starts off with the very first stage of a so called log-in screen. Here the person can type whether the input would be by a new user or and existing user.

If they represent the latter then they would have to type in '*n*'.

Once through we would be presented by the other half of the login screen.

Here we type in our username and password.

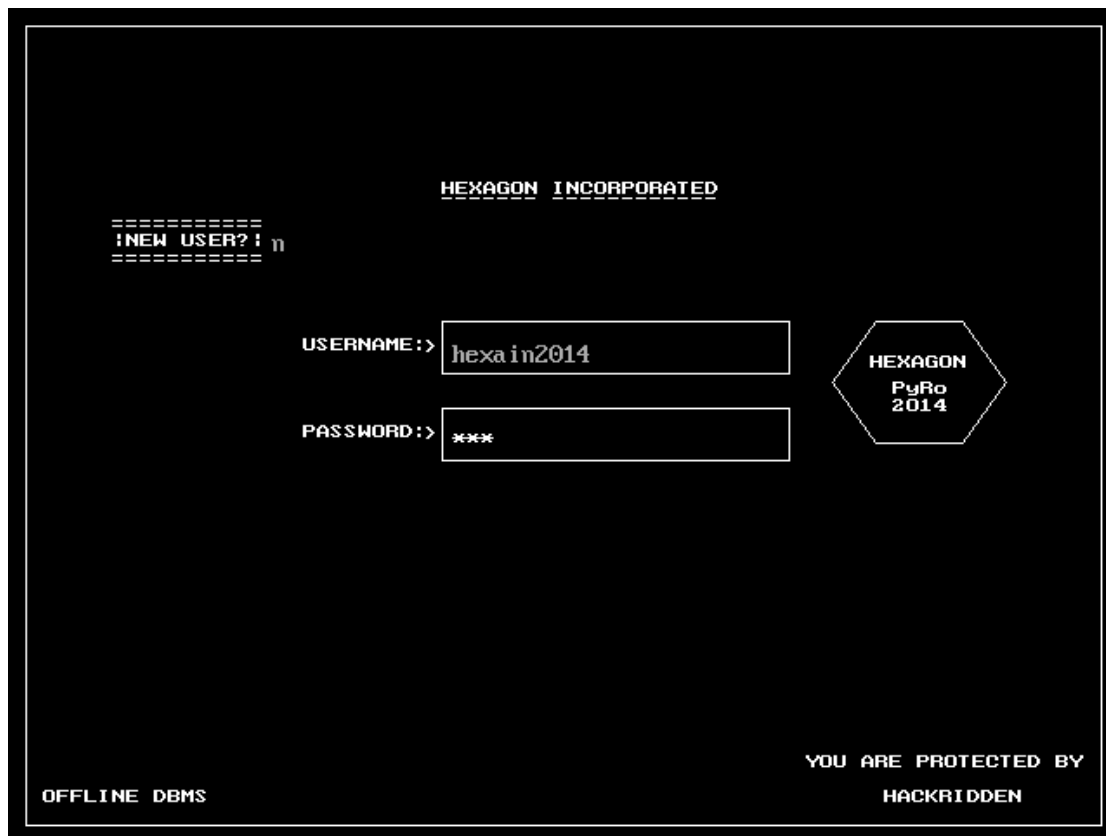

We have referred to this password program under the Tag name **HACKRIDDEN**.

Currently what matters in this portion is the password i.e. the Administrator Password.

For quick use we have kept it as '**abc**'.

Also the logo seen on the right hand side of the screen has been completely made out of graphics using **moveto** and **lineto** commands.

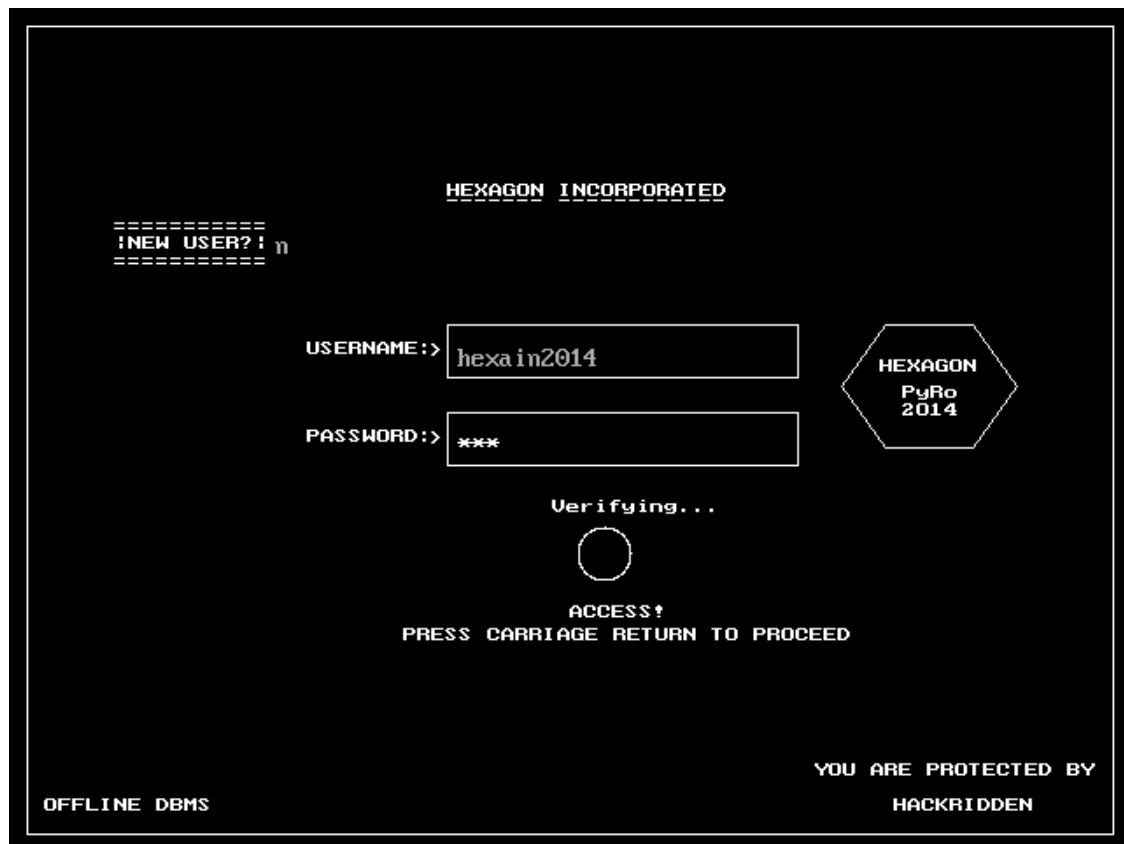

For display purposes we have put **hexain2014** in place of **username**.

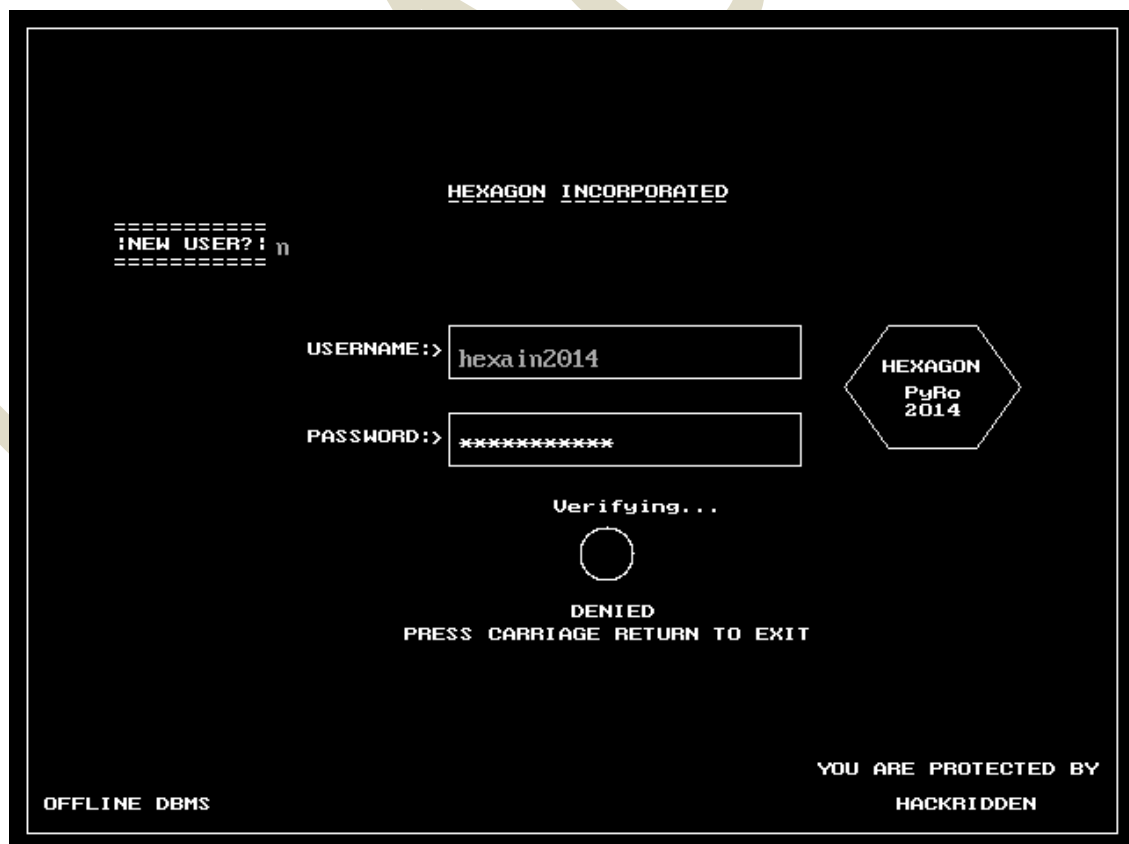

Once this password is typed in (regardless we give the username or not) it would verify the password and give us feedback whether it is an **Access** or **Denied**.

One more thing we have tried to do is to solve the case when both the username and password do not match. For this we have written a small piece of code for a **GUEST** account which is a **Read-Only** type of account. For example, from this account one can **view** data but not **feed** data.

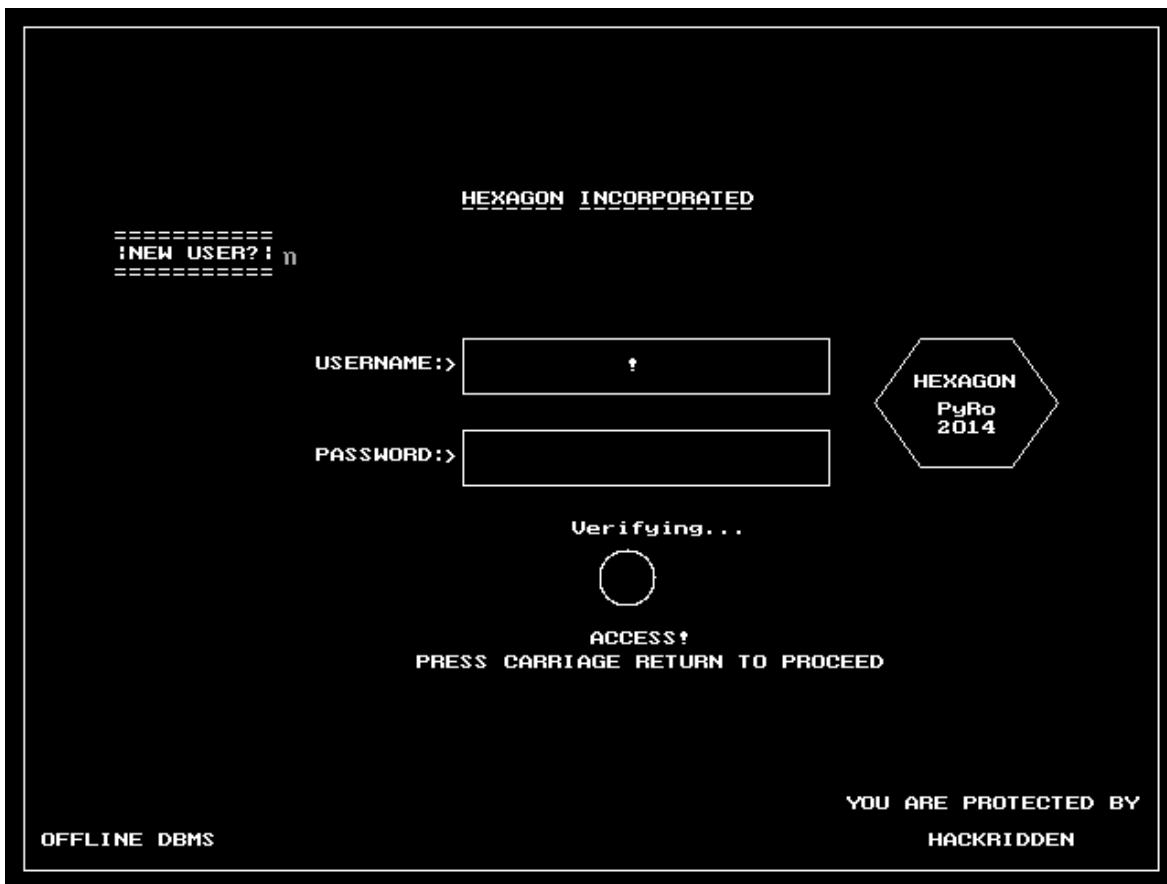

Speaking in a Layman's Language data can be **Read** but not **Modified**.

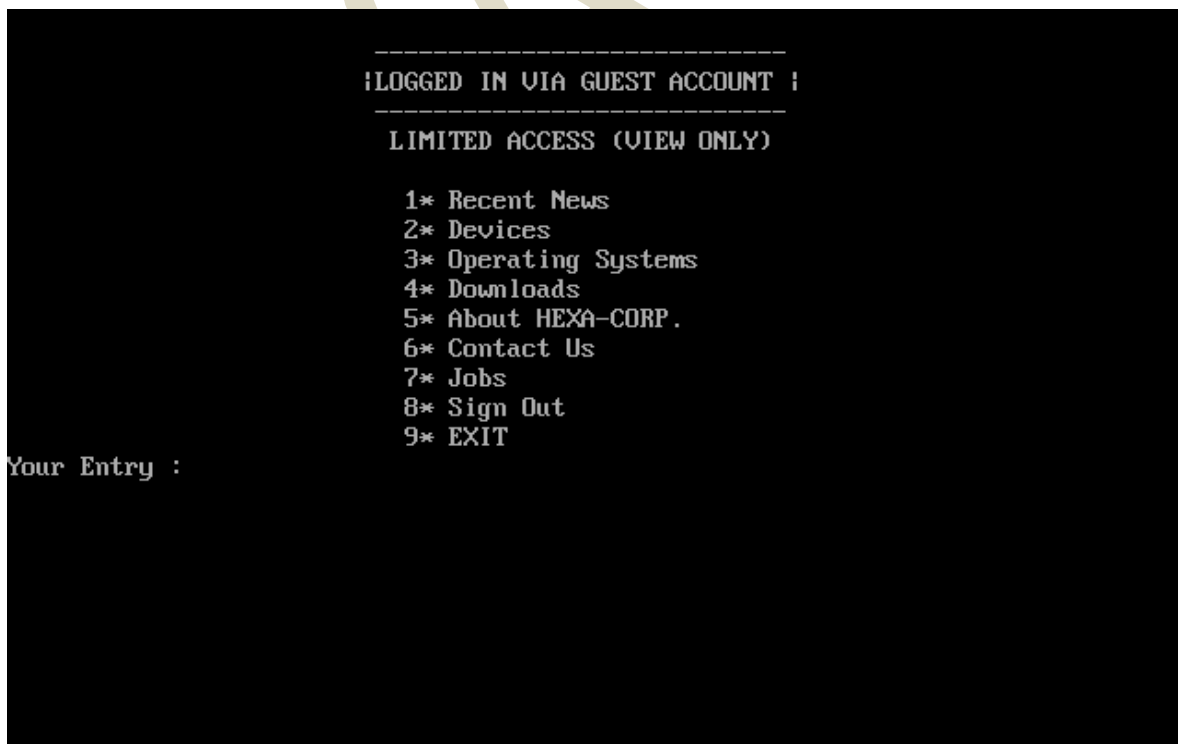

Screen showing Success

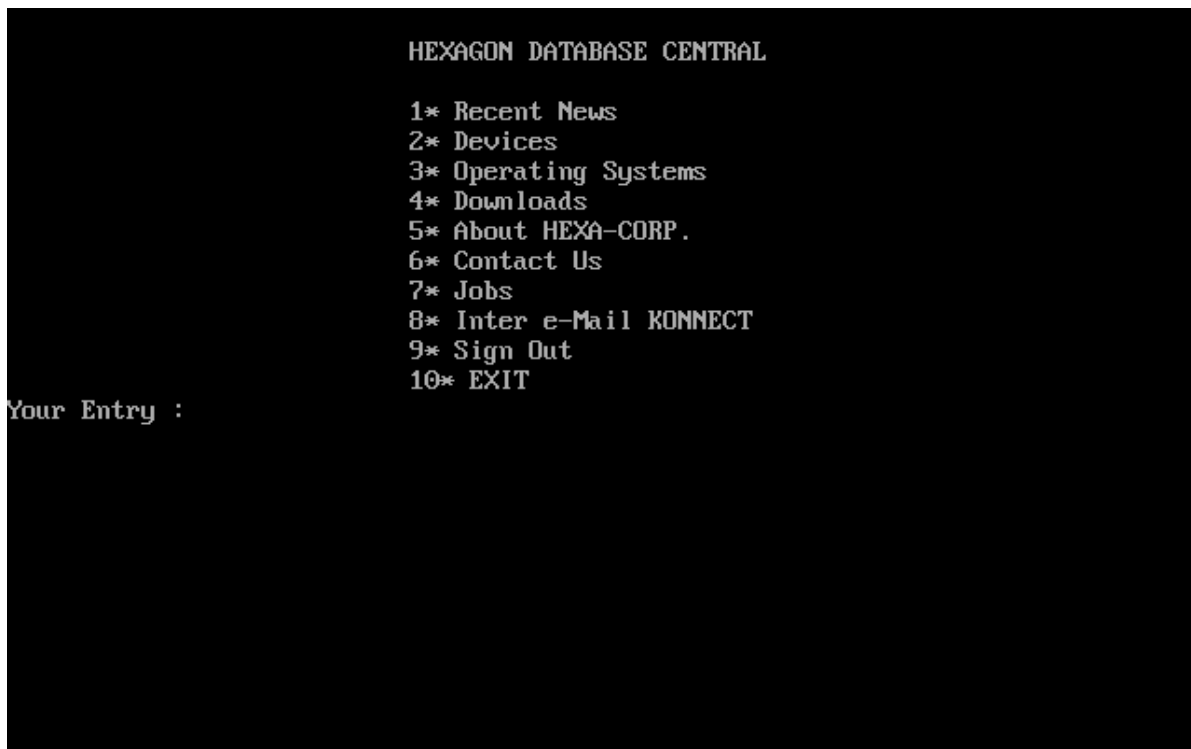

Screen showing Failure

*Guest Account Access*

*Guest Account Capabilities*

Now if we have passed the security test we can go forward and access the main Database. We have shown a very simple menu driven program over here.

So let us show some of the features we have included in this program.

Choice inputs made in the program will be self-explanatory.

# SCOPE FOR Modification

The project had been developed successfully but there is always a scope for modification. Due to limited time, development had not been completed as expected. But it is an aim to further develop this as soon as time is available. We had planned sharing of files via lan network but multiple user system is not complete. Hence this has a scope up to dual users including the administrator. File management was another plan but it required hours of code. But the work is satisfactory and we hope it stands in the eyes of the invigilator.
